The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase trageted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-concluded as neuroprotective, cytostatic and antinflammatory. The described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2'-methoxyethy1 (2'-mog) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records Acca0880-Acca0857 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-conclude and portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate consounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating calsease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40089-ACC40057 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                            superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-conflowed specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-conflowed so from pounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antiseense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligomounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records AcC40089-AcC40057 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                        /mod_base= OTHER

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-

1. The compound specifically hybridising with at least an 8-

2. of human superoxide dismutase 1 by hybridising with at least an 8-

2. constribed as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligomucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC40057 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                 /not \overline{c} "Phosphorothioate linkages. All cytosines are 5-methylcytosine"
                                                                                                                                                                    Human, superoxide dismutase 1, antisense, neuroprotective, cytostatic, antiinflammatory, amyotrophic lateral sclerosis, apoptosis, hyperproliferative disorder; therapy, infection, inflammation; tumour,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compounds targeted to nucleic acids encoding human

                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase of human superoxide dismutase 1 by hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition
                                                                                                                                                                                                                                                                                                                                                                                                                 /mod_base= OTHER

ö
of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyortrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40857 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  /mod_base= OTHER

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase.

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-concentration of the mucleic acid molecule encoding the active site of nucleobase portion of the mucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy ago. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating calisases or condition associated with this enzyme inditisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40980-ACC40957 represent human control of the interaction of prophylactically antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase to The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-cool nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antihollammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate colisonnoucleotides having 2-methoxyethy1 (2'-MoE) wings and a decxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, estimant and a superoxide of the invention as a research reagent, estimant and the proportion of the invention as a research reagent.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-c nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be specially anyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC40057 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                          superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel antisense compounds targeted to nucleic acids encoding human
                                                                    /note= "2'-methoxyethyl (2'-MOE) nucleotides"

Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.

Claim 3; Page 76; 107pp; English

```
The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibites the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition are useful for inhibiting the expression of a disease or condition are useful for inhibiting the expression of a disease or condition are leaved and the analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 20 BP; 4 A; 5 C; 8 G; 3 T; 0 U; 0 Other;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase to farm the compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridistal with at least an 8-conclesse portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate of human superoxide dismutase 1 expression by chimeric phosphorothicate of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from abberrant apoptosis and a hyperproliferative disorder. It may also be prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20 BP; 3 A; 5 C; 8 G; 4 T; 0 U; 0 Other;

Human superoxide dismutase 1 antisense inhibitor # ISIS 150443.

BP

ACC40889 standard; DNA; 20

23-MAY-2003 (first entry)

ACC40889;

The invention relates to a compound of 8-50 nucleobases in length,
targeted to a nucleic acid molecule encoding human superoxide dismutase

T. The compound specifically hybridises with and inhibits the expression
of human superoxide dismutasel by hybridisting with at least an 8concleobase portion of the nucleic acid molecule encoding the active site
of concleopase portion of compounds of the invention may be
described as neuroprotective, cytostatic and antiinflammatory. The
mechanism of action of compounds of the invention is antisense inhibition
of human superoxide dismutase 1 expression by chimaric phosphorothicate
oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a decxy gap.
Compounds of the invention are useful for inhibiting the expression of
human superoxide dismutase 1 in human cells or tissues, and for treating
a disease or condition associated with this enzyme (antisense therapy),
especially amyotrophic lateral sclerosis, a disease or condition arising
from aberrant apoptosis and a hyperproliferative disorder. It may also be Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis. ô
nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2'-methoxyethyl (2'-MOE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                         used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /note= "Phosphorothioate linkages. All cytosines are 5-methylcytosine"

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase.

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be mechanism of action of compounds of the invention and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorochipate coligonucleotides having 2'-methoxyethyl (2'-McE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                         used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay inflection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       /mod_base= OTHER

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase conformation of the nucleic acid molecule encoding the expression of human superoxide dismutase 1 by hybridises with at least an 8-conformation of the nucleic acid molecule encoding the active site of human superoxide dismutase 1 by hybridising with at least an 8-conformation of the nucleic and antinflammatory. The described as neuroprotective, cytostatic and antinflammatory. The conforman of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2-methoxyethy1 (2'-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. trophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records AcC40880-ACC40857 represent human constructions superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              5
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;
                                                                                                                                                                                                                                  Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase an treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           /mod_base= OTHER

                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-c nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2-methoxyethy1 (2'-MOS) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme startisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                  Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-

1. The compound specifically hybridising with at least an 8-

1. The carryon of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be

2. Compounds of the invention as antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2'-methoxyethyl (2'-MOS) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human calls or tissues, and for treating the man superoxide dismutase 1 in human calls or tissues, and for treating especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                  Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

Bennett FC,

Claim 3; Page 76; 107pp; English

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of the mucleic acid molecule encoding the active site of nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2'-methoxyethy1 (2'-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating channal supercation associated with this enaryme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40080-ACC40057 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

Sequence 20 BP; 3 A; 8 C; 3 G; 6 T; 0.U; 0 Other;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be mechanism of action of compounds of the invention may be mechanism of action of compounds of the invention is antiense inhibition of human superoxide dismutase 1 expression by chimacic phosphorothioate Compounds of the invention stands and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of

superoxide dismutase 1, for modulating expression of the dismutase a treating diseases or conditions, e.g. amyotrophic lateral sclerosis. Novel antisense compounds targeted to nucleic acids encoding human

The invention relates to a compound of 8-50 nucleobases in length, crargeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-compounds of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be cascribed as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate of human superoxide dismutase 1 expression by chimeric phosphorothicate compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                              used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human, superoxide dismutase 1; antisense; neuroprotective; cytostatic; antiinflammatory; amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy; infection; inflammation; tumour;

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase to The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-concleobase portion of the nucleic acid molecule encoding the active site of human superoxide dismutase 1 by hybridising with at least an 8-concleotion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxypethy (2'-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme lantisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records Acc40880-ACC40857 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                   Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase an treating diseases or conditions, e.g. amyotrophic lateral sclerosis.

and

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase.

1. The compound specifically hybridises with and inhibite the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothioate oligonucleotides having 2-methoxyethyl (2'-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. The current sequence represents the human superoxide dismutase forward primer sequence

```
The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase.

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-nucleobase portion of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be escribed as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate coligonuclectides having 2'-methoxyethyl (2'-MoB) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                              used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. The current sequence represents the human superoxide dismutase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               /note= "Phosphorothioate linkages. The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase

1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase. In hybridisising with at least an 8-.

2. The compound specifically hybridising with a least an 8-.

2. The enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethyl (2'-hoß) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating human superoxide dismutase 1 in human cells or tissues, and for treating captesses or condition associated with this enzyme (antisense therapy), especially amystrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      /mod_base= OTHER

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compounds specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-conjounds of the nucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethy| (2'-MoE) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition associated with this enzyme disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records AcC40880-ACC40857 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                                                                                                                  Novel antisense compounds targeted to nucleic acids encoding human superoxide dismutase 1, for modulating expression of the dismutase and treating diseases or conditions, e.g. amyotrophic lateral sclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; superoxide dismutase 1, antisense, neuroprotective, cytostatic; antiinflammatory, amyotrophic lateral sclerosis; apoptosis; hyperproliferative disorder; therapy, infection, inflammation; tumour;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human superoxide dismutase 1 antisense inhibitor # ISIS 150493.
                     /note= "2'-methoxyethyl (2'-MOE) nucleotides"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Score 20; DB 1; Length 20; Pred. The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically bybriddises with and inhibits the expression of human superoxide dismutase 1 by hybriddising with at least an 8-compounds of the enzyme. The activity of compounds of the invention may be controlled as neuroprotective, cytostatic and antiinflammatory. The mechanism of action of compounds of the invention may be mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothinoate oligonucleotides having 2'-methoxyethyl (2'-MCB) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating a disease or condition arising error and an appetosis and a hyperproliferative disease. It may also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40880-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides

The invention relates to a compound of 8-50 nucleobases in length, targeted to a nucleic acid molecule encoding human superoxide dismutase 1. The compound specifically hybridises with and inhibits the expression of human superoxide dismutase 1 by hybridising with at least an 8-conclease portion of the mucleic acid molecule encoding the active site of the enzyme. The activity of compounds of the invention may be described as neuroprotective, cytostatic and antinflammatory. The mechanism of action of compounds of the invention is antisense inhibition of human superoxide dismutase 1 expression by chimeric phosphorothicate oligonucleotides having 2'-methoxyethy! (2'-MoS) wings and a deoxy gap. Compounds of the invention are useful for inhibiting the expression of human superoxide dismutase 1 in human cells or tissues, and for treating compounds of the invention associated with this enzyme (antisense therapy), especially amyotrophic lateral sclerosis, a disease or condition arising from aberrant apoptosis and a hyperproliferative disorder. It may also be used in diagnostics, therapeutics and as a research reagent, e.g. prophylactically to prevent or delay infection, inflammation or tumour formation. Sequences given in records ACC40980-ACC40957 represent human superoxide dismutase 1 antisense inhibitor oligonucleotides
                                                                                                                                                                                                                                                       /mod_base= OTHER
